Abstract (en)  
[origin: WO2017030558A1] A shuttle (20) for a climbing protection system (10) is provided and includes a clamping member (26) mounted on a frame (22) for movement between a free position wherein the shuttle (20) can move freely along an elongate support member (12) and a clamping position wherein the clamping member (26) resists movement of the shuttle (20) relative to the elongate support member (12), and a blocking member (28) mounted on the frame (22) for movement between a closed position blocking removal of the elongate support member (12) and an open position where the blocking member (28) does not block removal of the elongate support member (12). The clamping member (26) is movable to an opening position wherein the clamping member (26) operably engages the blocking member (28) to move the blocking member (28) from the closed position to the open position.
