Abstract (en)

[origin: CA3022814A1] The invention relates to a device for forming a level crossing for crossing a track section having two rails, comprising at least one between-rail molded body, which is arranged between the two rails, at least one first and one second rail-outside molded body, which adjoin the outside of the first and the second rails, respectively, at least one transverse bore through the rail web of at least one of the two rails in the region of one of the adjacent molded bodies, and at least one fastener, which extends through the transverse bore in the rail web of the rail, wherein at least one of the molded bodies can be detachably fastened to the rail through the transverse bore by means of the fastener.
