Abstract (en)
[origin: WO2017029023A1] The invention relates to a pedal device. For the actuation, a pedal element 14, 18 is deflectable in relation to a basic element 12. A bearing element 26 is accommodated and rotatably mounted in at least one bearing shell 32, 34 on the basic element 12. The bearing element 26 comprises at least one first bearing sub-element 22 and a second bearing sub-element 24 which is movable in relation to the first bearing sub-element 22. The first bearing sub-element 22 is connected to the pedal element 14, 18. At least one resetting element 20 acts on the second bearing sub-element 24. In order, with as compact a design as possible, to permit secure mounting of the pedal element with damping of the deflection movement, the first and second bearing sub-elements 22, 24 are arranged with respect to each other in such a manner that they are supported against each other at at least one support point 38. When the pedal element 14, 18 is deflected counter to the action of the resetting element 20, an outwardly directed press-on force arises on the bearing sub-elements 22, 24 such that the latter are pressed onto the bearing shell 32, 34.
