Abstract (en)
[origin: WO2017032742A1] The invention relates to a motor vehicle lock, comprising a supporting structure (2) for holding at least one locking element (3, 3a, 3b) and a lock mechanism (5), wherein the lock mechanism (5) can be put into different function states and, for this purpose, has a function element (6) that can be moved into different function positions corresponding to the function states, wherein a drive assembly (7) having a drive train (8) to the function element (6) is provided for the motorized adjustment of the function element (6), wherein an actuating element (9) is provided, by means of the actuation motion of which said locking element (3, 3a, 3b) can be actuated, wherein the function element (6), in one function position, guides the actuation motion of the actuating element (9) either into a free-movement path (F), in which the actuating element (9) moves freely, or into an actuation path (B), in which the actuating element (9) actuates the locking element (3, 3a, 3b), and for this purpose applies a guiding force to the actuating element (9), the force flow of which guiding force runs outside of the drive train of the drive assembly.
