Abstract (en)

[origin: CA2996227A1] The invention relates to a cable connector (6). This cable connector has a shielding sleeve (2) comprising a first section with a first opening and comprising a second section with a second opening that is angled with respect to the first section. The first section additionally has a third opening positioned on the longitudinal axis of the first section opposite the first opening. The second section has a slit-shaped opening connecting the second opening to the third opening. A cable (3) is guided through the first opening and through the second opening of the shielding sleeve (2). The cable connector (6) can be produced in that a first end of the cable (3) is inserted through the third opening into the first section of the shielding sleeve (2) and is then fed through the first opening back out of said first section. The cable (3) is consequently bent such that a part of the cable (3) is moved through the slit-shaped opening into the second section of the shielding sleeve (2) and a second end of the cable (3) protrudes out of the second opening of this shielding sleeve (2).
