Abstract (en)  
[origin: WO2017035368A1] A networked communication session is defined vis-à-vis parameter information received from a first device, and access to the networked communication session is provided to the first device. Access to the networked communication session is further provided to each of additional device(s) in accordance with information associated with each of the additional device(s). A composited interactive audio/video feed is generated and transmitted that comprises audio/video input received during the networked communication session from each of the devices. Each of the devices is configured via a gesture-based user interface to enable user-based selection and respective manipulation of at least a portion of the composited audio/video feed that results in a customized representation of the composited audio-video feed at a particular one device that is not represented at a particular other of the device(s).
