Abstract (en)

[origin: WO2017037563A1] A plurality of measured product ion spectra are produced using a DIA tandem mass spectrometry method for a sample of two or more known proteins. A desired confidence probability for the identification of at least one known protein of two or more known proteins is received. Two or more combinations of N theoretical product ions that are exclusive to the at least one known protein are calculated. The at least one known protein is identified by finding product ions in the plurality of measured product ion spectra that match two or more of the two or more combinations of N theoretical product ions that provide a combined confidence probability greater than or equal to the desired confidence probability.
