Abstract (en)

[origin: EP3348763A1] An intermediate arm is composed of at least two sections, including a channel section ( 1 ) having shelves ( 12 , 13 ) of various widths, and a Z-bar ( 2 ). The lower shelves ( 12, 22 ) of these two sections face each other and the opposite upper shelves ( 13 , 22 ) of the two sections are adjacent to one another and are inseparably connected, especially by clinch connection. The intermediate arm has an articulated connection to the trough ( 3 ) by means of two connectors ( 51, 52 ) , which together with the trough ( 3 ) and the intermediate arm form an articulated quadrilateral. The intermediate arm assembly has also a sash lifting support mechanism, whose slider ( 61 ) moves in the trough ( 3 ) and is connected by a support bracket ( 62 ) to the Z-bar ( 2 ) of the intermediate arm.
