Abstract (en)  
[origin: EP3348929A1] It is a problem of the present invention to provide an air conditioning indoor unit that can reduce midway spreading of a rearward and downward airflow and generate a sufficient amount of the rearward and downward airflow. In an air conditioning indoor unit (10), outlet air traveling through an air passage space sandwiched between a front flap group (30) (a front flap (31) and an auxiliary front flap (32)) and a rear flap (40) proceeds along the air passage space in a state in which forward spreading of the outlet air is blocked by the front flap (31) until the outlet air reaches lower than a lowermost end of an air outlet (15), and when the outlet air leaves the air passage space, the outlet air becomes an airflow along a second surface (40b) of the rear flap (40), so an "unfelt airflow" heading toward a lower portion of a side wall is sufficiently generated.
