Abstract (en)  
To ease restrictions on airflow control without compromising design attractiveness in a wall-mounted air conditioning indoor unit. A recessed portion (57) that is upwardly recessed is formed in a rear end portion of an air direction adjustment member lower surface (52) of an air direction adjustment member (50). The air direction adjustment member (50), when generating a first airflow heading in the direction of an installation side wall from an air outlet (27), adopts a first posture in which its upper surface rotates rearward relative to a vertical plane so that its front end is positioned more rearward than its rear end (56). The air direction adjustment member (50) is attached in such a way that a lower edge (27b) of the air outlet (27) enters the recessed portion (57) when the air direction adjustment member (50) adopts the first posture.
