Abstract (en)  
[origin: WO2017046477A1] The invention mainly concerns a method for determining a substitution temperature (Ts) for substituting a coolant liquid at a measured temperature (Tm) in order to control a heat engine, said heat engine being combined with a cooling circuit in connection with an additional heater, characterised in that, when said additional heater has been used prior to the starting of the heat engine, said method comprises:  
- a step of calculating said substitution temperature (Ts) from heating profiles of the coolant liquid depending, in particular, on an activation period (Dact) of said additional heater, and  
- a step of transmitting said substitution temperature (Ts) to an engine computer in order to ensure the control of said heat engine.
