Abstract (en)
[origin: EP3351443A1] Provided is an electric braking system configured to prevent antilock control from being unintentionally ended so that the braking behavior can be stabilized. An antilock control function unit (22) includes an antilock control intervention determination unit (29) configured to determine whether or not to execute antilock control. A braking force control device (2) includes a switching function unit (23) configured to switch between follow-up control by a normal control unit (21) and the antilock control by the antilock control function unit (22) on the basis of the determination by the antilock control intervention determination unit (29). The antilock control intervention determination unit (29) ends execution of the antilock control when, for example, a braking force under the antilock control becomes equal to or higher than a required braking force while the antilock control is being executed.
