Abstract (en)

[origin: EP3351719A1] The screening arrangement (100) comprises an extensible screen (6) with an upper end portion (61) and a bottom end portion (62). The screen (6) is wound onto a roller shaft (1) arranged at the top of a window. When the extensible screen (6) has been brought to its maximum unwound position corresponding to a first deployed position, in which the screen is in a relaxed state, the roller shaft (1) is rotated further to wind the screen (6) reversely onto the roller shaft (1) and in combination with the traction cords (3) which hold the bottom end portion (62) of the extensible screen (6) stationary this applies a tensional force on the extensible screen (6) such that the extensible screen (6) is variably stretched.
