Abstract (en)

[origin: EP3351740A1] A section (46) of a gas turbine engine includes a rotor blade (102) configured to rotate about an axis. The section also includes a case (100) positioned radially outward from the rotor blade (102) and extending circumferentially about the axis. The section (46) also includes a control ring (104) being annular, positioned radially inward from the case (100) and configured to move radially relative to the case (100). The section (46) also includes a segmented blade outer air seal (BOAS) (106) including a plurality of BOAS segments each being positioned radially outward from the rotor blade (102), movably coupled to the control ring (104; 204; 304), and configured to move circumferentially relative to each other such that a circumferential gap between each of the plurality of BOAS segments changes in size in response to a temperature change in the section of the gas turbine engine. A gas turbine engine, comprises a compressor section configured to compress air; a combustor section configured to receive compressed air from the compressor section, to combust a mixture of the compressed air and fuel, and to output exhaust; and a turbine section configured to convert the exhaust into torque to power the compressor section.
