Abstract (en)

A problem to be solved by the present invention is to provide an immunochromatographic test strip that can avoid aggregation of colloidal gold conjugates while red blood cells in whole blood are agglutinated and then separated and removed in the case of using hexadimethrine bromide as a blood-agglutinating agent and the colloidal gold conjugates as a detection reagent. To solve the problem, the present inventors reviewed a past reagent configuration itself from a completely different viewpoint rather than selecting type and amount of polyanions and, as a result of extensive study on each element, the inventors surprisingly found that aggregation of colloidal gold can be suppressed by a certain buffer solution without using neutralization by polyanions, wherein a buffer solution component is impregnated in a conjugate-retaining part in the test strip, the buffer solution component is selected from a group consisting of Bis-Tris, MES, and citric acid, and wherein Bis-Tris and MES are at pH lower than pKa.
