Abstract (en)  
[origin: CN108361648A] Provided is a lighting device (DE). The lighting device comprises at least one light source (SL) capable of generating a photon and a shielding part (M) enabling the generated photon to pass at a pre-reserved location. The shielding part (M) comprises a front surface (FV). The front surface faces exterior orientation and is equipped with three-dimensional elements (ET) with each comprising a non-transparent main surface (FP) and at least one side surface (FL). The at least one side surface tilts towards the main surface (FP) and ensures connection between the main surface (FP) and a main surface (FP) of at least one adjacent another three-dimensional element (ET). Additionally, at least one side surface is transparent in order to form one of a pre-reserved location where the generated photon passes.
