Abstract (en)

[origin: EP3358024A1] Provided is a cheek plate for an apparatus for agglomerating reduced iron, the cheek plate including: a cover portion which has a fan shape and is installed at each of both sides of a pair of rollers for processing the reduced iron to prevent the reduced iron from leaking to a lateral space formed between the rollers; roller close contact portions which protrude from inner rim portions of the cover portion and are in close contact with outer portions of the rollers to maintain airtightness of the space between the rollers; and gas discharge portions which extend along plate surfaces of the roller close contact portions, and discharge gas produced when processing the reduced iron, thereby effectively discharging gas produced when processing the reduced iron while increasing close contact force between the cheek plates and both sides of the rollers.
