Abstract (en)
[origin: CN108392137A] The invention relates to a suction head (1) of a vacuum cleaner comprising: a base (5), at least one brush (13, 14), a connecting sleeve (2), and a fork (3), wherein the fork (3) is arranged between the base and the sleeve and pivotally connected relative to the base and the sleeve about a transverse axis (X1). The suction head (1) comprises a lever (20) configured to be three position drive mechanisms so as to lower and position the at least one brush (13, 14) by pivoting the fork (3) relative to the base (5) from the lower surface (15) at a first position; enable at least one of the brushes (13, 14) to be raised and positioned to retract from the lower surface (15) at the second position through the pivoting of the fork (3) relative to the base (5); enable at least one of the brushes (13, 14) to remain retracted from the lower surface (15) by the locking of the fork (3) relative to the base (5). The invention also relates to a vacuum cleaner equipped with such a suction head (1).
