Abstract (en)  
[origin: WO2017065768A1] An adornment assembly for an article has a base assembly made up of a plurality of layers in stacked relationship. A first of the layers has a thickness between oppositely facing first and second surfaces. A second layer has a thickness between oppositely facing third and fourth surfaces. The first surface is for application to an exposed surface on an article. The base assembly has an exposed surface on one of the layers that faces oppositely to the first surface. A discrete component has a thickness between oppositely facing surfaces and is applied to the base assembly so that one of the oppositely facing component surfaces is exposed for viewing together with the exposed surface on the one of the plurality of layers on the base assembly. At least a part of the thickness of the discrete component resides within the combined thickness of the base assembly.
