Abstract (en)  
[origin: WO2017064012A1] The invention provides a holding device comprising a locking member having a longitudinal axis, an external surface and a first end, an actuator for displacing said locking member along its longitudinal axis between a holding position and a released position, a guiding part, for engaging said external surface of said locking member and guiding its displacement functionally along its longitudinal axis, and an alignment sensor for detecting alignment with another device having a complementary guiding part, complementary with said locking member, said alignment sensor functionally coupled with said actuator for displacing said locking member when alignment with said complementary guiding part is sensed.
