Abstract (en)
[origin: WO2017064191A1] The invention relates to a device for adjusting the position of an elevator system, comprising position measuring means (14), which can be paired with an elevator car (2) that can be moved in an elevator shaft (6) and which are designed to generate position data corresponding to a current shaft position of the elevator car, and comprising position control means (34), which interact with the position measuring means (14) and which are paired with configuration means (16) that can be actuated manually and/or by means of data input means such that in response to a manual actuation and/or an actuation of the data input means, a plurality of car stop positions which can be distributed along the elevator shaft can be adjusted and stored. A mobile data processing unit (26) which is wirelessly linked to the configuration means and which has a display unit (28) is paired with the configuration means (16) such that position data corresponding to the plurality of car stop positions can be displayed together on the display, in particular in a tabular form and/or in the form of graphical elements, and the mobile data processing unit has manually actuatable operating means (28) for changing at least one item of position data and for transmitting the changed item of position data to the configuration means.
