Abstract (en)
[origin: CA3002293A1] The invention relates to a closure device (1) for closing a container opening (3) of a container (2), in particular a drinks bottle, wherein the closure device (1) has a lid element (4), a chamber (6) arranged on the cover element (4) and an inner housing (5), wherein the chamber (6) and the inner housing (5) have closing means and opening means corresponding to one another, which interact with one another in such a way that a medium contained in the chamber (6) can move into the container (2) as a result of a movement of the lid element (4) relative to the inner housing (5). According to the invention, in order to create an alternative closure device, which is particularly simple to produce and can be produced from as few individual components as possible, the closure means is a closure pin (7) which is securely connected to the chamber (6), and which can be removed from a closure opening (8) of the inner housing (5) forming the opening means by means of a movement of the lid element (4) relative to the inner housing (5).
