Abstract (en)
[origin: US2018245369A1] A window/door securing device for securing a leaf, in particular an outwardly opening leaf, of a window or door in a closed position in which the leaf contacts a frame of the window or door comprises a base body and a counter-piece that is selectively latchable to the base body so that on a fastening of the base body to the frame and of the counter-piece to the leaf, the leaf can be secured in the closed position by latching the counter-piece to the base body. The base body has two installation surfaces so that one of the installation surfaces of the base body can be selectively placed on and fastened to the frame. In this respect, two installation surfaces are aligned perpendicular to one another.
