Abstract (en)

In a power converting device (1), an anode lead plate (8) and a cathode lead plate (9) are disposed opposed in an interior of an insulating plate (3), whereby the respective current directions are opposed and a magnetic field is negated, because of which inductance is reduced. Also, as external connection terminals (13), which are end portions of the anode lead plate (8) and the cathode lead plate (9), pass through the interior of the insulating plate (3) and are disposed in another space of the case (2) from a lower portion of the insulating plate (3), the wiring distance between a capacitor element (4) and a power semiconductor module (16) is short, and inductance can be reduced.
