Abstract (en)
[origin: WO2018162106A1] The invention relates to a forming device and method, wherein at least one spindle is rotationally driven by a rotary drive, a workpiece is received on the spindle by means of a clamping device and clamped on the spindle, and at least one forming roller is applied axially and/or radially relative to the workpiece in order to carry out a compression rolling or metal spinning process. According to the invention, the spindle and the clamping device are combined to form an exchange unit, which can be moved transversely to the axis of rotation, wherein the exchange unit is moved between a forming position and a set-up position.
