Abstract (en)

A pressing type latch device includes a seat (1), a pivotal seat (2) mounted in the seat (1), and a handle (3) having a grasping portion (31) pivotably connected to two eccentric locations of the pivotal seat (2), such that a greater operational height can be formed when the handle (3) is lifted. When the latch device is in one of a plurality of retainable open positions or a retainable closed position, the grasping portion (31) of the handle (3) can be moved to a position to lift the pivotal seat (2), such that the grasping portion (31) of the handle (3) lies flush with the pivotal seat (2). When the grasping portion (31) of the handle (3) is lifted to move the pivotal seat (2) downward, the handle (3) and the pivotal seat (2) can rotate freely.
