Abstract (en)
[origin: WO2017082727A2] A painting tool including a paint reservoir and a brush with brush hairs jointly defining a conical brush surface tapering in a sharp brush tip. Further, the painting tool includes a paint supply tube and a nozzle with a supply channel in which the brush and the paint supply tube are fastened. In the brush a brush channel is formed which is bounded by brush hairs and of which a distal end forms an opening in the brush surface. The paint supply tube extends in a proximal part of the brush channel. The brush hairs bounding the paint supply tube extend beyond the distal end of the paint supply tube and preferably by such a length that the brush hairs at a reduced pressure in the paint reservoir move towards each other so that the outlet opening of the paint supply tube is substantially closed off by the brush hairs. On the nozzle an adjustable guiding element may be arranged for stable positioning of the brush tip with respect to the surface to be painted.
