Abstract (en)

[origin: WO2017081198A1] The invention relates to a securing system (100) for securing a person on an elevated working plateau (153) of an object (150), in particular a container, wherein the working plateau (153) is bounded at least by a first edge (151) and a second opposite edge (152) of the object (150). A first support cable (101) can be arranged and fastened along the first edge (151), and a second support cable (102) can be arranged and fastened along the second edge (152). A first securing cable (103) is fastened to a first fastening point (106) on the first support cable, and the person can be coupled at a first coupling point (107) of the first securing cable (103). A second securing cable (104) is fastened to a second fastening point (108) on the second support cable, and the person can be coupled at a second coupling point (109) of the second securing cable (104). The first securing cable (103) and the second securing cable (104) have securing lengths that are shorter than a support-cable securing distance.
