Abstract (en)
[origin: WO2017137116A1] The invention relates to a lock arrangement (3) of a motor vehicle, which comprises a lock housing (4), a rotatably mounted rotary latch (6), which can be moved into a main latching position and an open position, a pivotably mounted pawl (9), which can be moved between a blocking position and a release position, and a control element (11) which is coupled in movement to the pawl (9), is pivotably mounted and can move the pawl (9) from the blocking position into the release position. The lock arrangement (3) is characterized in that an immobilizing lever (16) is mounted on the lock housing (4) so as to be pivotable between a standby position and an immobilizing position in which the immobilizing lever (16) blocks a rotation of the rotary latch (6) arranged in its main latching position, wherein the immobilizing lever (16) is coupled to the pawl (9) in such a way that the immobilizing lever (16) pivots into its immobilizing position only when the pawl (9) is arranged in the blocking position.
