Abstract (en)
[origin: WO2017080791A1] The invention relates to a method for calibrating a sensor (3) of a motor vehicle (1), wherein a respective received signal is continuously received by two receiving devices (9, 9') of the sensor (3) by means of a computing device (7) while the motor vehicle (1) is moved relative to an object (8), said received signal describing a sensor signal which is transmitted by the sensor (3) and reflected by the object (8). A measurement angle (α) between the sensor (3) and the object (8) is determined using a phase difference ($\Delta\phi$) of the received signals, and the relative position between the sensor (3) and the object (8) is continuously determined using the received signals. The computing device (7) determines a reference time (t_0) when the relative position corresponds to a specified reference position for which a reference angle (β) between the sensor (3) and the object (8) is known, the measurement angle (α) is determined for the reference time (t_0), and the sensor (3) is calibrated using a comparison of the measurement angle (α) for the reference time (t_0) with the reference angle (β).
