Abstract (en)
Suction-type cleaning vehicle (100) having an independent liquid-based filtration system (141) to remove dust particles from exhaust air. The exhaust air may be from a debris suction mechanism, in which an air flow draws debris into a collection chamber . The liquid-based filtration system can act as an additional filter to remove dust that gets past the collection chamber (132), so that any dust which was not deposited in the collection chamber is prevented from escaping to the atmosphere. This can greatly reduce the amount of dust present in air emitted from the debris suction mechanism.
