Abstract (en)
[origin: WO2017083894A1] The invention relates to a slide-in device (13) for sliding in a moveably mounted furniture part (3) into a closed end position relative to a furniture body (2), comprising: a driver (14) that can be detachably coupled to the moveable furniture part (3); at least one spring device (16) for applying the force of the driver (14) against a pull-out direction (31) of the driver (14), wherein the spring device (16) can be tensioned via a spring holder (17) that is separate from the driver (14) in the pull-out direction (31) of the driver (14); a coupling device (30) for movement coupling between the driver (14) and the spring holder (17), wherein, via the coupling device (30), the distance (D) of a securing point (18) of the spring device (16) on the spring holder (17) relative to the driver (14) changes when pulling out the driver (14) in the pull-out direction (31), wherein the coupling device (30) has at least one control element (22) with a longitudinal axis (23) running in the pull-out direction (31), wherein, during the pulling out of the driver (14) in the pull-out direction (31), to change the distance (D) occurring between the securing point (18) and the driver (14), the control element (22) rotates about the longitudinal axis (23) at least in sections.
