Abstract (en)
[origin: CA3005651A1] The invention relates to a motorized humanoid robot (50) that has a positioning axis (11) extending along a reference axis (12) in a reference position and is able to move on a horizontal plane (13), comprising a first wheel (14) and a second wheel (15) in contact with the horizontal plane (13). According to the invention, the robot (50) comprises a base (17) having a left-hand surface (18) which, in a vertical plane passing through the centre of the wheels (14, 15), extends on either side of each of the wheels (14, 15), the left-hand surface (18) being able to form, at any point on the left-hand surface (18), a first point of contact with the horizontal plane (13), defining a centre of rotation (O) for any first point of contact, and the robot (50) is configured such that the centre of rotation (O) and the centre of gravity (G) of the robot (50) are offset so as to generate a torque that tends to return the robot (50) to the reference position from any position in which its positioning axis (11) forms a non-zero angle with the reference axis (12).
