Abstract (en)

[origin: WO2017084862A1] The invention relates to a domestic refrigeration appliance, in particular a cooling and/or freezing appliance, comprising at least one appliance closure element (22a) for at least partially covering at least one useful space (16a) and comprising an air exchange unit (10a; 10b), which has at least one flow channel (12a; 12b) arranged at least partially on the appliance closure element, which at least one flow channel connects a surrounding region (14a) to the useful space (16a) in respect of flow, which air exchange unit is provided for enabling an exchange of air between the surrounding region (14a) and the useful space (16a) at least at times in at least one operating state. The aim of the invention is to improve a mode of operation. This aim is achieved in that at least one air inlet opening (18a; 18b) of the flow channel (12a; 12b) is arranged at least substantially perpendicular to a main plane of extent of the appliance closure element (22a).
