Abstract (en)

[origin: WO2017084782A1] The invention relates to a method for operating an input device (12), in which, by means of a touch-sensitive display device (14), a graphic user interface (20) is displayed and, by means of an actuator (16) a response that can be detected by touch is output on the display device (14) as long as a sweep over the display device (14) in the area of the displayed graphic user interface (20) by means of a finger (26) is detected, wherein an intensity of the response that can be detected by touch is predefined on the basis of a speed at which the display device (14) in the area of the display graphic user interface (20) is swept over by the finger (26). The invention further relates to an input device (12) having a touch-sensitive display device (14), to an actuator (16) for outputting a response that can be detected by touch on the display device (14), and to a control device (12) for driving the actuator (16).
