Abstract (en)

[origin: WO2017089665A1] The invention relates to an aerodynamic wheel cover (EA) fitted to a wheel (RV) of a vehicle, comprising a rim (JR) extending in longitudinal, transverse and vertical directions of the vehicle, and a runout (VR) provided with radial apertures (AR). Said wheel cover (EA) comprises vanes (PE) separated by air passages and having a profile designed to deflect a lateral air flow from the outside towards the radial apertures (AR) or vice versa. Each vane (PE) has a theoretical thrust axis having a curvature selected in a first plane constructed from longitudinal and vertical directions, and placed at a selected distance (d1) from a plane parallel to the first plane and located at the interface with the outside of the wheel (RV), in addition to a section, in a second plane constructed from transverse and vertical directions, having a selected general incline ( $\Theta$ ) in relation to the first plane.
