Abstract (en)

[origin: WO2017089378A1] The invention relates to an anchor point (1) for, for example, lifting and/or lashing down an object (2). The anchor point (1) comprises a base (4) designed such that it can be fixed to the object (2) in such a way that it can rotate about a rotational axis (7). The anchor point (1) also comprises a retainer (3) held on two bearing points (5) on the base (4) such that it can be tilted about a tilt axis (11) in relation to said base. The aim of the invention is to prevent the retainer (3) from sticking when a force is applied, which can lead to a sudden and jerky shift in the retainer or even fracturing of the anchor point (1) and crashing of the load. To this end, the tilt axis (11) can be moved in relation to the base (4). Preferably, a rocker (25), for example, is provided on at least one bearing point (5).
