Abstract (en)  
[origin: WO2017091065A1] Device (1) for parking cycles (2), comprising a frame (4), which is rotatable around a rotation axis (3) by means of first drive and control means, and a number of multi-cycle modules (5), which are coupled to the frame, wherein the multi-cycle modules are arranged for containing multiple cycles being positioned one above the other, wherein the device is further arranged for vertical displacement of the multi-cycle modules within the frame by means of second drive and control means, wherein the first and second drive and control means are arranged in such a manner, that each cycle is introduced and removed through a geometrically fixed access location (9) by means of rotation of the frame and/or by vertical displacement of the multi-cycle modules. Preferably, the rotatable frame essentially extends above or below the fixed access location.
