Abstract (en)
[origin: WO2017090066A1] An intrusion-preventing device (1) for a frame (2) of a building is described, comprising a fastening system, for connecting the device (1) to a wall recess (3) for housing the frame (2), and a central element (5) composed of: an internal tubular element (5b), equipped at an end with a second connecting element (4b) and equipped on an external surface with holes adapted to connectingly receive a projection placed on the lower surface of a first end of one or more blocking elements (10); at least one external tubular element (5a), equipped at an end with a first connecting element (4a) adapted to be strictly coupled with a first component (8a) of the fastening system, adapted to house the internal tubular element (5b) coaxially connected to the external tubular element (5a); and a fastening element (7), arranged at an end of the external tubular element (5a), equipped on an external surface with a plurality of housings adapted to connectingly receive a second end of each of the blocking elements (10).
