Abstract (en)
[origin: WO2017091124A1] A device (100) for transforming wave energy into rotating motion comprises a shaft (110) and a section (120). The section comprises a body (130) having a passage (140) for receiving a wave (200, 800, 900). A first member (150) is movably arranged in the passage between a resting position (151) and an elevated position (152). The first member is arranged to be elevated by the wave. A weight (160) is movably arranged between a resting position (161) and an elevated position (162). The weight is arranged to be elevated by the first member. A first coupling arrangement (170) transfers motion of the weight to the shaft. The weight is arranged to be moved by gravity towards its resting position, thereby generating, via the first coupling arrangement, a rotating motion of the shaft. In some embodiments, the weight is disconnectable from the first member for allowing upward motion of the first member relative to the weight.
