Abstract (en)

[origin: EP3382097A1] Removable insulating device for grooved rails, intended to insulate a grooved rail (200) of the type used in laying tracks for trams and arranged in an urban track, for insulation from external conditions. The device prevents the need for adhesives, which enables the removal and introduction thereof in a vertical direction. Flanges or additional protruding areas prevent it from moving freely or leaving the rail in a situation of use, but with the help of tools, said protruding areas can be acted upon in order to remove it when necessary, without needing to perform lateral eliminations of the track cladding, as well as the reinsertion of the device on the track after finishing said work.
