Abstract (en)

[origin: WO2017095460A1] A dressing or device to distribute pressure for the purpose of prevention and treatment of wounds and intact skin is provided. The pressure distributing properties are achieved by a closed cell foam material that is in direct contact with the intact skin or wound and that can also have the ability to manage and absorb moisture. These unique characteristics creates a flexible, and easy to use dressing that can be cut to size and applied to any desired location on a patient.
