Abstract (en)

[origin: EP3385490A1] A screening body for a screening arrangement including a top element defining a longitudinal direction, said screening body comprising a plurality of slats and a fabric layer having a top surface and a bottom surface, each slat extending in a longitudinal direction between two end edges and having first and second side edges parallel to the longitudinal direction, the screening body being adapted to be wound up in and rolled out from said top element in a direction perpendicular to said longitudinal direction to a screening position in which the screening body defines a general screening plane; in which each of the slats is composed of at least one metal strip connected to the fabric layer, wherein the at least one metal strip is coated on at least the side facing the fabric layer and that an adhesive layer binds the metal strip to the fabric layer.
