Abstract (en)

[origin: CA3007572A1] The control station (20) of the work platform (10) of an aerial lift, comprises: - a control console; - a cover (40) protecting the console that can be moved between a closed position and an open position; - a longitudinal element - such as a bar (42) - linked to the cover so as to move together between the open and closed positions, the longitudinal element, when the cover is open, projecting relative to the front side of the console; and - means for detecting an external force pushing the longitudinal element towards the console when the cover is open. This helps protect the operator from being crushed against the console when the platform moves. Moreover, the longitudinal element does not hinder the opening or closing of the cover and is moved out of the way when the cover is closed, which prevents it from being exposed to impacts.
