Abstract (en)

[origin: WO2017097469A1] A method for identifying a snow- or ice- (40) covered diaphragm (20) of an electroacoustic sensor (1), particularly of an ultrasonic sensor, on a vehicle is proposed. The method comprises the following steps: a.) A time-based temperature profile for an interior (15) of the electroacoustic sensor (1) is ascertained after the beginning of sensor operation by a temperature sensor (80) that is arranged in the interior (15) of a housing (10) of the sensor. The temperature of the sensor interior (15) is below 0 °C at the beginning of sensor operation. b.) A second temporal range of the ascertained temperature profile is identified by a computation unit (95), in which range the temperature increase falls significantly in comparison with a first range at a preceding time. c.) If a temporal range of this kind is identified, then it is inferred that the diaphragm (20) of the electroacoustic sensor (1) is covered with snow or ice (40). d.) If it has been identified that a diaphragm (20) of the electroacoustic sensor (1) is covered with snow or ice (40), then a warning is output to the driver.
