Abstract (en)
[origin: WO2017098394A1] The present invention relates to a flyback mechanism comprising a flyback wheel (3), a flyback lever (4) pivoted on the flyback wheel (3), and isolation claws (21) arranged so that the arms pivot between a first rest position in which the flyback lever (4) is in contact with the flyback core (1) and a second isolating position in which one of the active ends (22) engages with the isolation lever (4) so as to pivot same against the action of the flyback spring (9) thereof into a position in which it is no longer in contact with the flyback core (1). The blocking means (18) are arranged relative to the isolation claws (21) in order to block the flyback wheel (3) before the isolation claws (21) come into contact with the flyback lever (4) when said isolation claws (21) pivot into the second isolation position thereof.
