Abstract (en)

[origin: CA3059641A1] The invention relates to a screw device for applying torque to a screw partner (12), comprising flat output means (10) provided with an output member that can be detachably connected to the screw partner and a drive to which a drive torque can be manually or mechanically applied, particularly by means of an interconnected angular and/or bevel gear (16), and means (48) for detecting an output torque acting on the screw partner on the output side, the detection means associated with the flat output means and particularly provided on and/or in a housing (30, 32) of the flat output means being designed such that they can detect an axial force acting on a helical gear (38) connecting the drive and the output member of the flat output means in a torque-transmitting manner and provide same for preferably electronic signal evaluation.
