Abstract (en)

[origin: WO2017102966A1] What is described is an elevator car (1) which has at least one balustrade (15) attached to a roof (13) of the elevator car (1), which balustrade can be pivoted about a rotation axis between a folded-down position, in which the balustrade (15) is arranged essentially horizontally, and a raised position, in which the balustrade (15) is arranged essentially vertically. The balustrade (15) is mechanically coupled to a 3-state switch (19) which can adopt three different switching states. The balustrade (15) and the 3-state switch (19) are thus designed to cooperate such that the 3-state switch (19) adopts a first switching state when the balustrade (15) is in the folded-down position, the 3-state switch (19) adopts a second switching state when the balustrade (15) is in the raised position, and the 3-state switch (19) adopts a third switching state when the balustrade (15) is in neither the folded-down position nor the raised position.
