Abstract (en)  
[origin: WO2017103017A1] The invention relates to a fastening module (1), which is used to fasten a rail foot (6) of an elevator rail (2) to a fastening plane (4), which fastening module comprises a first fastening device (15), which, when assembled, is fastened to the fastening plane (4) and is used to hold a first side (7) of the rail foot (6), and a second fastening device (16), which, when assembled, is fastened to the fastening plane (4) and is used to hold a second side (8) of the rail foot (6). The second fastening device (16) can be moved at least substantially parallel to the fastening plane (4). At least one element (17A) of the second fastening device (16), which element, when assembled, interacting with a top side (13) of the rail foot (6) facing away from the fastening plane (4), can be rotated about an axis of rotation (52) of the second fastening device (16) at least substantially perpendicularly to the fastening plane (4), over the top side (13) of the rail foot (6) from laterally outside of the rail foot (6). The invention further relates to an elevator system (3) having a plurality of such fastening modules (1). The invention further relates to a method for fastening a rail foot (6) of an elevator rail (2), carried out using a fastening module (1).
