Abstract (en)
[origin: WO2017103080A1] The invention relates to a composition comprising at least one structural adhesive and at least one chemically crosslinked elastomer based on a silane-functional, non-polar polymer, said elastomer being provided in the form of a penetrating polymer network in the structural adhesive. Self-supporting adhesive bodies, particularly in the form of adhesive tapes, can be produced from such compositions and can be used for structural bonds and to reinforce metal structures.
